

# IBM Storwize V7000

*Most powerful and easy-to-use innovative midrange disk system in the storage marketplace.*

## Do more with less...

In storage management today, breaking the cycle of increased complexity and explosive data growth can be a big challenge. The old ways of buying and managing storage have become less effective. Due to resource constraints – both physical storage resources and human resources – IT organisations must act quickly to optimise and simplify their infrastructure. Unchecked complexity and growth will only become bigger problems over time.

The **IBM Storwize V7000** has been developed to address the challenges found in the majority of storage environments by consolidating storage silos together, giving a single point of management, and adding storage virtualisation features to existing storage which would not natively support them.

- **Easy tier™ dynamic on the fly data migration to solid state disk (SSD) for application performance improvement.**
- **Integration with existing storage infrastructure to provide a single point of management.**
- **Storage migration from existing storage platforms.**
- **Thin-provisioning for flexible storage management.**
- **Fibre channel and iSCSI connectivity to hosts.**
- **Simple easy to use management GUI.**
- **True storage tiering.**
- **Mirroring and Replication.**
- **Scales to 240 disks and can still support external disk virtualisation**
